

How to install Chrome extension or app

Many of my chrome extensions and apps are in “unpacked”, open source file form, instead of on the chrome web store. This comes with benefits, but it takes a bit longer to install. Follow these steps to add them to your chrome/chromebook.

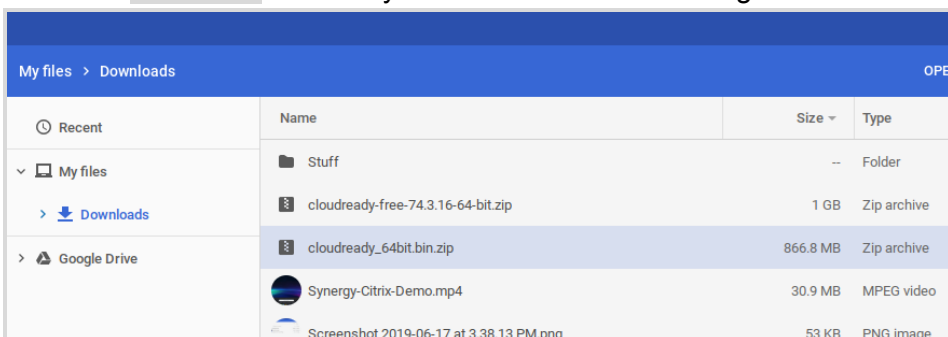

Note: chrome extensions (not apps) are *not* exclusive to chromebooks.

This guide uses the context of a chromebook, but any device will work in a similar way.

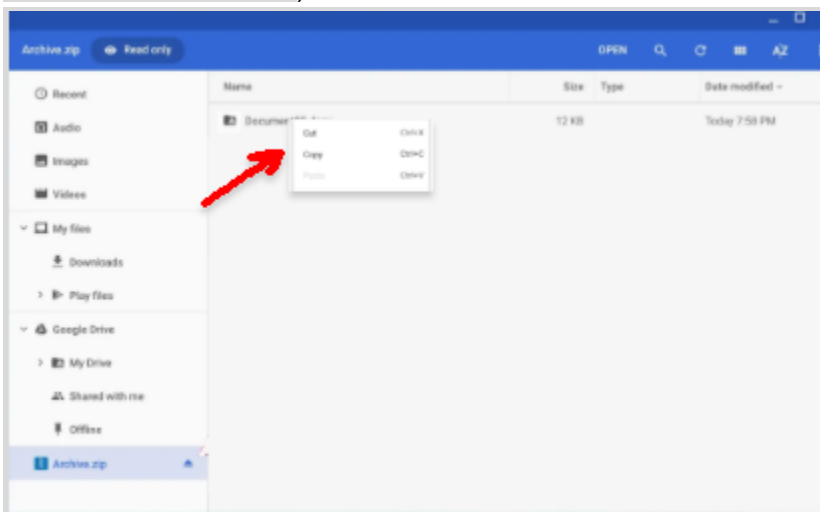

1. Download the `.zip` file onto your chromebook (from google drive link on <https://cadecraft.herokuapp.com>, github repository, or wherever you got it from). If there are multiple versions, it is suggested that you download the latest version.

2. Enter the `Downloads` folder in your chromebook file manager and double-click the `.zip`

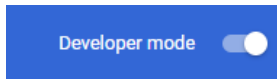

3. Copy the folder that is inside the `.zip` (it should be called something like `ExtensionName_v0.0.0`)

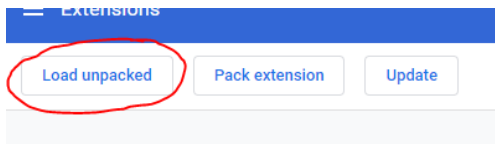

4. Paste it somewhere else on your chromebook (ideally create a folder for all of your extensions for organization)
5. Go to `chrome://extensions` in google chrome

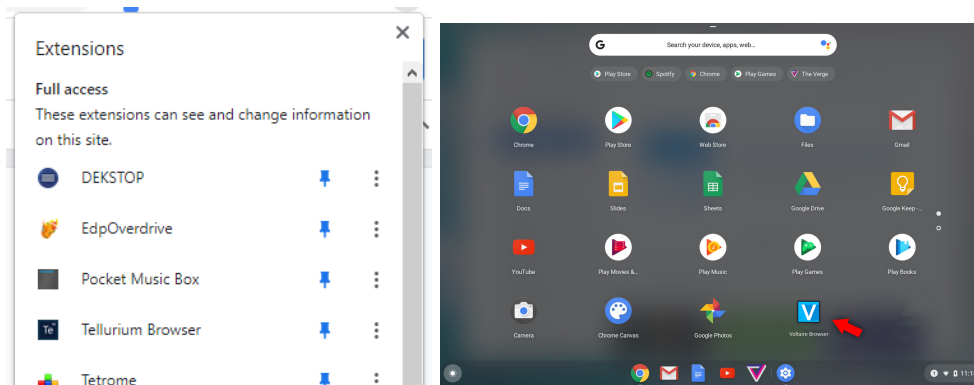

6. Enable Developer Mode in the top right

7. Click the Load Unpacked button in the top left

8. Select the extension folder that you had pasted (should be called something like ExtensionName_v0.0.0), and confirm.
9. Your extension or app is loaded. Now, if it is an extension, click the extensions menu (puzzle piece) in the top right and scroll down to pin it. If it is an app, open the chromebook apps list (search key) and then you will see the app icon there.

Questions?

Join the Discord Server to give me feedback and suggestions on my games and tools (or just if you're bored). I am always happy to help ^_^
